WASTE TANK SUMMARY REPORT

B. M. Hanlon

ABSTRACT

This report is the official inventory for radioactive waste stored in underground tanks in the 200 Areas at the Hanford Site. Data that depict the status of stored radioactive waste and tank vessel integrity are contained within the report. This report provides data on each of the existing 177 large underground waste storage tanks and 63 smaller miscellaneous underground storage tanks and special surveillance facilities, and supplemental information regarding tank surveillance anomalies and ongoing investigations. This report is intended to meet the requirement of U. S. Department of Energy-Richland Operations Office Order 435.1 (DOE-RL, July 1999, Radioactive Waste Management, U. S. Department of Energy-Richland Operations Office, Richland, Washington) requiring the reporting of waste inventories and space utilization for Hanford Tank Farm tanks.

WASTE TANK SUMMARY REPORT FOR MONTH ENDING MAY 31, 2000

Note: Changes from the previous month are in bold print.

I. WASTE TANK STATUS

| Category | Quantity | Date of Last Change |
|--|------------------------------------|-----------------------------|
| Double-Shell Tanks ^b | 28 double-shell | 10/86 |
| Single-Shell Tanks | 149 single-shell | 1966 |
| Assumed Leaker Tanks | 67 single-shell | 07/93 |
| Sound Tanks | 28 double-shell 82 single-shell | 1986 07/93 |
| Interim Stabilized Tanks ^a | 124 single-shell | 05/00 |
| Not Interim Stabilized ^a | 25 single-shell | 05/00 |
| Intrusion Prevention Completed | 108 single-shell | 09/96 |
| Controlled, Clean, and Stable ^c | 36 single-shell | 09/96 |
| Watch List Tanks ^d | 21 single-shell 6 double-shell | 12/99 ^e 06/93 |
| Total | 27 tanks | |

^a Of the 124 tanks classified as Interim Stabilized, 65 are listed as Assumed Leakers. (See Table G-1)

^b Six double-shell tanks are currently included on the Hydrogen Watch List and are thus prohibited from receiving waste in accordance with "Safety Measures for Waste Tanks at Hanford Nuclear Reservation," Section 3137 of the *National Defense Authorization Act for Fiscal Year 1991*, November 5, 1990, Public Law 101-510.

^c Two of these tanks are Assumed Leakers (BY-105, BY-106). (See Table F-1)

^d See Appendix D for more information on Watch List Tanks.

^e Dates for the Watch List tanks are "officially added to or removed from the Watch List" dates. Eighteen tanks were removed from the Organic Watch List in December 1998; two tanks still remain on this watch list. In December 1999, tank C-106 was officially removed from the High Heat Load Watch List.

^f The TY tank farm was officially declared Controlled, Clean, and Stable (CCS) in March 1996. The TX tank farm and BX tank farms were declared CCS in September 1996.

II. WASTE TANK INVESTIGATIONS

This section includes all single- or double-shell tanks or catch tanks which are showing surface level or interstitial liquid level (ILL) decreases, or drywell radiation level increases in excess of established criteria.

A. Assumed Leakers or Assumed Re-leakers: (See Appendix H for definition of "Re-leaker")

This section includes all single- or double-shell tanks or catch tanks for which an off-normal or unusual occurrence report has been issued, or for which a waste tank investigation is in progress, for assumed leaks or re-leaks.

Tanks/catch tanks will remain on this list until either a) completion of Interim Stabilization, b) the updated occurrence report indicates that the tank/catch tank is not an assumed leaker, or c) the investigation is completed.

There are no formal leak investigations in progress. There are no tanks for which an off-normal or unusual occurrence report has been issued for assumed leaks or re-leaks.

B. Tanks with increases indicating possible intrusions:

This section includes all single-shell tanks and related receiver tanks for which the surveillance data show that the surface level or ILL has met or exceeded the increase criteria, or are still being investigated.

Candidate Intrusion List: Increase criteria in the following tanks indicate possible intrusions.

Tank 241-B-202
 Tank 241-BX-101
 Tank 241-BX-103
 Tank 241-BY-103

The surveillance data was last reviewed on the tanks listed as having probable liquid intrusions: Memo 74B20-99-045, dated November 22, 1999.

Catch Tank 241-AX-152: The liquid level in this catch tank was steady around 66.75 inches from the startup of Project W-030, "Tank Farm Ventilation System," in March 1998 until late August 1998. The level then began to decrease. The October 1998 reading of 65 inches is 1.75 inches below the summer average. This is an active catch tank, routinely pumped, and deviations from baseline are not applicable per OSD-00031. The decrease represents a significant change in trend and it is apparent that tank conditions changed around the end of August 1998.

Resolution Status: Discrepancy Report #98-853 was issued on November 4, 1998. One possible cause under investigation is a change in flow path, causing an increase in evaporation. The tank was pumped down to 2.25 inches on November 13, 1998. Since that time the level has decreased to 0.00 inches. The Discrepancy Report will remain open until an engineering investigation is complete.

The discrepancy remained unresolved, and there was a renewed interest in this tank because of its importance for deactivation of the 702A ventilation system to prepare it for Decommissioning and Deactivation and for collection of drainage from AX-155. In the absence of an agreement on a leak test, management requested a leak assessment. The leak assessment team met April 20, 2000, to review the data. Observations inconsistent with a conclusion that the catch tank was leaking and scanty data prompted the leak assessment team to defer a decision pending availability of additional data - primarily tank temperature and a more sensitive level measuring device to shorten the necessary leak test time. A Leak Test Recommendation was issued May 8, 2000. The leak test will involve adding water to the tank and measuring the level drop, to support tank integrity assessment.

Work Package ES-99-00133 to perform vapor sampling to support resolution of a flammable USQ for the facility has been prepared; work is expected to begin late July or August 2000.

III. SURVEILLANCE AND WASTE TANK STATUS HIGHLIGHTS

1. **Single-Shell Tanks Interim Stabilization (See Table G-1 footnotes for further information)**

Tank 241-SX-106 - This tank was declared interim stabilized May 5, 2000. Total pumped: 147.5 Kgallons, total waste: 396.6 Kgallons; no supernate; DIL 37.2 Kgallons; DLR 37.2Kgallons; PLR 30.6 Kgallons; no sludge; saltcake 396.6 Kgallons.

2. Single-Shell Tanks Saltwell Jet Pumping (See Table A-6 footnotes for further information)

Tank 241-A-101 - Pumping began May 6, 2000, five months ahead of schedule. In May 2000, a total of 2.1 Kgallons was pumped from this tank.

Tank 241-S-102 - Pumping continued until November 17, 1999, when pump problems forced a shutdown. The pump was replaced and pumping resumed on February 19, 2000. Problems with the new pump forced a shutdown on March 23, 2000. Pumping resumed May 23, 2000. In May 2000, a total of 3.3 Kgallons was pumped; a total of 56.9 Kgallons has been pumped from this tank since pumping started in March 1999.

Tank 241-S-106 - Pumping was discontinued on January 3, 2000, to allow the waste levels to stabilize, so waste porosities and final waste volumes can then be calculated to determine whether this tank meets Interim Stabilization criteria.

Tank 241-U-102 - Pumping commenced January 20, 2000. In May 2000, a total of 6.8 Kgallons was pumped; a total of 33.2 Kgallons has been pumped from this tank since start of pumping in January 2000.

Tank 241-U-103 - Pumping commenced September 26, 1999. In May 2000, a total of 800 gallons was pumped; a total of 98.9 Kgallons has been pumped from this tank since start of pumping in September 1999.

Tank 241-U-105 - Pumping commenced December 10, 1999. In May 2000, a total of 8.0 Kgallons was pumped; a total of 79.9 Kgallons has been pumped from this tank since start of pumping in December 1999.

Tank 241-U-109 - Pumping commenced March 11, 2000. In May 2000, a total of 9.9 Kgallons was pumped; a total of 34.5 Kgallons has been pumped from this tank since start of pumping in March 2000.

3. Double-Shell Tank 241-SY-101 Waste Level Increase

Tank 241-SY-101 exhibited gas release events due to generation and retention of flammable gas. A mixer pump was installed in the tank in July 1993, which circulates liquid wastes. This prevents gas bubbles from building up at the bottom, and results in venting of small steady gas releases. Since early 1997, the surface level has been rising in spite of regular mixer pump operations.

Resolution Status: On February 11, 1998, the PRC recommended that the DOE-RL declare an Unreviewed Safety Question (USQ) over the continued level growth observed in this tank. The contractor has established a multi-disciplinary team to solve the level growth issues in SY-101. The prime near-term focus is to transfer approximately 100,000 gallons from SY-101. This objective was expanded to transfer approximately 500,000 gallons of waste from SY-101 so that sufficient water could be added to resolve the flammable gas issue.

Final calculated transfer and dilution volumes for level growth remediation, Memo 74B50-00-030, dated March 23, 2000:

Volumes in gallons, rounded to the nearest 500 gallons

| Campaign # | Date Campaign Began | Waste Transferred | "Original Waste" Transferred | In-Line Dilution Water | Top Back Dilution | Bottom Back Dilution | Total Back Dilution |
|------------|---------------------|-------------------|------------------------------|------------------------|-------------------|----------------------|---------------------|
| #1 | Dec. 18, '99 | 89,500 | 89,500 | 84,000 | 26,000 | 36,000 | 62,000 |
| #2 | Jan. 27, '00 | 240,500 | 230,000 | 198,000 | 89,500 | 150,000 | 239,500 |
| #3 | Feb. 29, '00 | 286,000 | 205,500 | 102,500 | 36,500 | 187,000 | 223,500 |
| Cumulative | | 616,000 | 525,000 | 384,500 | 152,000 | 373,000 | 525,000 |

Aggressive mixer pump operations were performed to most efficiently mix the dilution water in the tank waste. Once the tank waste is "well mixed," a controlled evaluation period will commence to observe the overall tank waste behavior without running the mixer pump. This controlled Mixer Pump Observation

Period (MPOP) began April 3, 2000. The MPOP suspends mixer pump runs (other than an occasional pump bump directed by the Technical Review Group) for a period of approximately 90 days. (See also Occurrence Report below)

4. RL-LMHC-TANKFARM-1999-0023. Occurrence Report. "Additional Information Regarding Crust Growth in 241-SY-101." Off-Normal Occurrence. Notification: April 9, 1999. Latest Update: April 27, 2000.

On December 18, 1999, approximately 90,000 gallons of nuclear waste was transferred from tank SY-101 to SY-102 in the first of three planned transfers.

In conjunction with the transfers, water is added to the waste to reduce the concentration of gas generation and gas-retaining chemicals to reduce gas buildup in SY-101 and associated receiving tanks.

The second of the three waste transfers was completed on January 27, 2000.

The third and final phase of transfers was initiated on February 29, and completed March 2, 2000.

On April 3, 2000, a Mixer Pump Observation Period (MPOP) began, and will continue for 90 days.

This report is being extended pending completion and evaluation of tank activities during the MPOP and resolution of the USQ issues.

5. RP-CHG-TANKFARM-2000-0016. Occurrence Report. "Loss of 241-SY-102 Primary Tank Leak Detection System (USQ)." Unusual Occurrence. Latest Update: May 31, 2000

On February 16, 2000, the SY-102 annulus conductivity probe instrumentation indicated an alarm condition. The annulus continuous alarm monitor (CAM) had been previously taken out of service for maintenance. These conditions caused the Primary Tank Leak Detection System to be inoperable. Limiting Condition for Operation (LCO) states that one of the two primary tank leak detection systems shall be operable.

Immediate efforts were made to replace the annulus stack CAM to restore annulus ventilation. Attempts to reset the annulus conductivity probe were not successful.

Additional time is needed to develop and approve the Root Cause Analysis and Corrective Action Plan.

A Final Report Update will be submitted no later than July 31, 2000.

6. RP-CHG-TANKFARM-2000-0023. Occurrence Report. "Failure of 296-P-16 Exhauster for 241-C-105/106 Tanks." Unusual Occurrence. Latest Update: May 24, 2000.

On March 10, 2000, a Loss of Vacuum alarm was received by TMACS. An Operator and HPT responded to the alarm and discovered the P-16 Exhauster was shut down.

An attempt to restart the exhauster resulted in the exhauster running approximately five minutes and again shutting down.

The Washington State Department of Health was notified.

An investigation into causes of the shutdown and development of a Work Plan for troubleshooting commenced.

This update is being submitted in order to allow additional time to perform PAAA screening, Root Cause Analysis and the Corrective Action Plan.

A Final Report will be submitted on or before June 30, 2000.

7. RP-CHG-TANKFARM-2000-0026. Occurrence Report. "AW-102/104 Annulus Continuous Air Monitor Radiation Hi Failure Alarm (USO)." Unusual Occurrence. Latest Update: May 5, 2000

On March 22, 2000, a loss of power resulted in a Radiation Hi Failure alarm on the AW-102/104 Continuous Air Monitor (CAM) and the unplanned entry into LCO 3.2.6.

The LCO requires either the annulus conductivity probe system or the annulus CAMs to be operable. Loss of power to the CAMs during maintenance on the separate conductivity probe system resulted in the unplanned entry.

The LCO was exited upon completion of the annulus conductivity probe functional test.

The cross-site transfer in progress was shut down. It was attempted to restore power to the CAM. The power breaker was found tripped. Troubleshooting the loss of power commenced.

Troubleshooting the loss of power to the CAMs continues.

This Update report is being submitted in order to allow additional time for PAAA screening, Risk Rank Value, Root Cause Analysis and Corrective Action Plan.

Troubleshooting revealed burned wiring at a junction box in a Confined Space.

The CAM system repair will require extensive planning to formalize the final repair package.

A Final report will be submitted on or before July 14, 2000.

8. RP-CHG-TANKFARM-2000-0034. Occurrence Report. "241-SY Exhauster Shutdown (USO)." Unusual Occurrence. Notification: April 25, 2000

During performance of the monthly CAM source check of the SY-Tank Farm primary exhauster, the CAM exhibited an unexplained high radiation count alarm while in the test mode, which caused the SY primary exhauster to shutdown on interlock.

This exhauster is required to be operational to prevent the possible accumulation of flammable gas in the SY double-shell tanks. Start-up of the P-28 back-up exhauster was unsuccessful due to a suspected pressure switch problem.

All unnecessary personnel were evacuated from the SY-Tank Farm. Entered action statements per Limiting Condition for Operation (LC) 3.2.1. All saltwell pumps discharging to tank SY-102 were secured and placed in short-term shutdown. No indicate of radiation release was detected.

An investigation was initiated to determine the cause of the unexpected high-count alarm. Troubleshooting began on the suspected P-28 pressure switch problem.

9. RP-CHG-TANKFARM-2000-0039. Occurrence Report. "Shutdown Interlock Failure for 241-S-102 Saltwell Recirculation Flush Water Pressure Detection System (USO). Unusual Occurrence; Notification: May 22, 2000.

During a waste transfer from S-102 saltwell pumping, a recirculation flush high pressure alarm activated on May 21, 2000. An unplanned entry into LCO for service of water pressure detection systems was initiated. Operations performed a manual shutdown of the saltwell pump, installed the administrative lock on the pump disconnect, and exited the LCO. No other transfers were in progress.

The saltwell pumping system had just been restarted, following pump replacement and pump priming. The crew reported that when the service water pressure detection alarmed, it did not provide the automatic interlock shutdown. Originally determined to be a non-safety class incident, it was categorized as an off-normal occurrence.

After a review of applicable authorization basis documentation, management determined that because the alarm location was not planned to be continuously manned, the failure of the interlock may represent a performance degradation of the pressure detection system, which is a safety class system. It was therefore recategorized from Off-Normal to Unusual Occurrence.

APPENDIX A
MONTHLY SUMMARY

TABLE A-1. MONTHLY SUMMARY

TANK STATUS

May 31, 2000

| | 200 EAST AREA | 200 WEST AREA | TOTAL |
|--------------------------------|------------------|------------------|--------|
| IN SERVICE | 25 | 03 | 28 (1) |
| OUT OF SERVICE | 66 | 83 | 149 |

Available Space Calculations Used in this DocumentTank Farms

AN, AP, AW, SY 1,140 Kgal

AY, AZ (Aging Waste) 980 Kgal

Notes: Drainable porosity measurements for DIL have been updated to 25% for saltcake and 15% for sludge, per HNF-2976, Rev. 1, "Updated Pumpable Liquid Volume Estimates and Jet Pump Durations for Interim Stabilization of Remaining Single-Shell Tanks," September 1999. These porosity values also apply to DSTs.

Also, DIL has been extracted from the DST solids waste volumes in this table. For this report: Supernate + DIL + Solids = Total Waste for DSTs

TABLE A-6. INVENTORY AND STATUS BY TANK - SINGLE-SHELL TANKS

May 31, 2000

THESE VOLUMES ARE THE RESULT OF ENGINEERING CALCULATIONS AND MAY NOT AGREE WITH SURFACE LEVEL MEASUREMENTS

FOOTNOTES:

Total Waste is calculated as the sum of Sludge and Saltcake plus Supernate. The category "Interim Isolated (II) was changed to Intrusion Prevention (IP) in June 1993.

Stabilization information from WHC-SD-RE-TI-178 SST STABILIZATION RECORD, latest revision, or SST Stabilization or Cognizant Engineer

Porosity values are 25% for saltcake and 15% for sludge, per HNF-2978, Rev. 1, "Updated Pumpable Liquid Volume Estimates and Jet Pump Durations for Interim Stabilization of Remaining Single-Shell Tanks," September 1999.

(a) SX-106 Following information from Cognizant Engineer

This tank was Interim Stabilized May 5, 2000.

(b) S-106 Pumping was discontinued on January 3, 2000, to allow the waste levels to stabilize, so waste porosities and final waste volumes can then be calculated to determine whether this tank meets Interim Stabilization criteria.

(c) U-105 Following information from Cognizant Engineer.

Saltwell pumping began December 10, 1999. The waste is pumped directly to SY-102.

Remaining volumes are based on the original estimated volumes in HNF-2978, Rev. 1.

Total Waste: 338.1 Kgal

Supernate: 0.0 Kgal

Drainable Interstitial Liquid: 44.1 Kgal

Pumped this month: 8.0 Kgal

Total Pumped: 79.9 Kgal

Drainable Liquid Remaining: 44.1 Kgal

Pumpable Liquid Remaining: 40.1 Kgal

Sludge: 32.0 Kgal

Saltcake: 306.1 Kgal

In May 2000, a total of 7,989 gal of fluid was removed, and a total of 581 gal of water was added for pump priming/equipment flushes, for a net removal of 7,408 gal of waste. In addition, 7,897 gal of water were used as dilution and 1,586 gal of water were used for transfer line flushes.

TABLE A-6. INVENTORY AND STATUS BY TANK - SINGLE-SHELL TANKS

May 31, 2000

THESE VOLUMES ARE THE RESULT OF ENGINEERING CALCULATIONS AND MAY NOT AGREE WITH SURFACE LEVEL MEASUREMENTS

FOOTNOTES:

(d) S-102 Following information from Cognizant Engineer

Pumping commenced March 18, 1999. The waste is pumped directly to SY-102. Pumping stopped on November 17, 1999, when problems with the pump developed. Pumping resumed on February 19, 2000, after the pump was replaced. Problems with the new pump forced a shutdown on March 23, 2000. No pumping in April 2000. Pumping resume May 23. Remaining volumes are based on the original estimated volumes in HNF-2978, Rev. 1.

Total Waste: 492.1 Kgal
Supernate: 0.0 Kgal
Drainable Interstitial: 93.2 Kgal
Pumped this month: 3.3 Kgal
Total Pumped: 59.5 Kgal
Drainable Liquid Remaining: 93.2 Kgal
Pumpable Liquid Remaining: 88.8 Kgal
Sludge: 105.0 Kgal
Saltcake: 387.1 Kgal

In May 2000, a total of 3,698 gal of fluid was removed with 419 gal of water added by flushes/priming for a net removal of 3,279 gal of tank waste. In addition, 71,660 gal of dilution water and 6,999 gal of water were added for transfer line flushes.

(e) U-109 Following information from Cognizant Engineer

Pumping began March 11, 2000.
Remaining volumes are based on the original estimated volumes in HNF-2978, Rev. 1.

Tank Waste: 430.5 Kgal
Supernate: 0.0 Kgal
Drainable Interstitial: 87.5 Kgal
Pumped this month: 9.9 Kgal
Total Pumped: 34.5 Kgal
Drainable Liquid Remaining: 87.5 Kgal
Pumpable Liquid Remaining: 83.5 Kgal
Sludge: 35.0 Kgal
Saltcake: 385.5 Kgal

During May 2000, a total of 10,533 gal of fluid was removed with 669 gal of water added by pump priming/equipment flushes, for a net removal of 9,864 gal of tank waste. In addition, 14,032 gal of dilution water and 1,001 gal of water were used for transfer line flushes.

TABLE A-6. INVENTORY AND STATUS BY TANK - SINGLE-SHELL TANKS

May 31, 2000

THESE VOLUMES ARE THE RESULT OF ENGINEERING CALCULATIONS AND MAY NOT AGREE WITH SURFACE LEVEL MEASUREMENT

FOOTNOTES:

(f) U-102 Following information from Cognizant Engineer

Pumping began in this tank on January 20, 2000.

Remaining volumes are based on the original estimated volumes in HNF-2978, Rev. 1.

Total Waste: 341.8 Kgal

Supernate: 0.0 Kgal

Drainable Interstitial Liquid: 63.8 Kgal

Pumped this Month: 6.8 Kgal

Total Pumped: 33.2 Kgal

Drainable Liquid Remaining: 63.8 Kgal

Pumpable Liquid Remaining: 59.8 Kgal

Sludge: 43.0 Kgal

Saltcake: 298.8 Kgal

During May 2000, a total of 7,348 gal of fluid was removed and a total of 551 gal of water was added by pump priming/equipment flushes, for a net removal of 6,797 gal of tank waste. In addition, 9,682 gal of water were used as dilution and 1,133 gal of water were used for transfer line flushes.

(g) U-103 Following information from Cognizant Engineer.

Saltwell pumping commenced September 26, 1999. The waste is pumped directly to SY-102.

The pump failed on May 11, 2000; the minimum inflow criteria was met, therefore the tank was put in Observation Mode in anticipation of successful interim stabilization review.

Remaining volumes are based on the original estimated volumes in HNF-2978, Rev. 1.

Total Waste: 369.1 Kgal

Supernate: 0.0 Kgal

Drainable Interstitial Liquid: 20.1 Kgal

Pumped this month: 0.8 Kgal

Total Pumped: 98.9 Kgal

Drainable Liquid Remaining: 20.1 Kgal

Pumpable Liquid Remaining: 16.1 Kgal

Sludge: 12.0 Kgal

Saltcake: 357.1 Kgal

In May 2000, a total of 1,300 gal of fluid was removed and 724 gal of water added for priming/flushes, for a net removal of 826 gal of waste. In addition, 5,225 gal of water were used as dilution and 1,012 gal of water were used for transfer line flushes.

TABLE A-6. INVENTORY AND STATUS BY TANK - SINGLE-SHELL TANKS

May 31, 2000

THESE VOLUMES ARE THE RESULT OF ENGINEERING CALCULATIONS AND MAY NOT AGREE WITH SURFACE LEVEL MEASUREMENTS

FOOTNOTES:

(h) A-101 Following Information from Cognizant Engineer

Pumping began on May 6, 2000.

Remaining volumes are based on the original estimated volumes in HNF-2978, Rev. 1.

Total Wastes: 891.0 Kgal

Supernate: 508.0 Kgal

Drainable Interstitial Liquid: 95.0 Kgal

Pumped this Month: 2.1 Kgal

Total Pumped: 2.1 Kgal

Drainable Liquid Remaining: 901.0 Kgal

Pumpable Liquid Remaining: 584.0 Kgal

Sludge: 3.0 Kgal

Saltcake: 380.0 Kgal

During May, a total of 4,340 gal of fluid was removed and a total of 561 gal of water was added by pump priming/equipment flushes. A total 1,000 gal of water and waste drained back into the tank during the first transfer, for a net removal of 2,122 gal of waste. In addition, 3,800 gal of water was used as dilution and 2,838 gal of water was used transfer line flushes.

APPENDIX B
PERFORMANCE SUMMARY

**TABLE B-1. SUMMARY OF WASTE TRANSACTIONS IN THE DOUBLE-SHELL TANK (DST) SYSTEM
MAY 31, 2000**

ALL VOLUMES IN KGALLONS

- The DST system received waste additions from SST Stabilization, 241-AZ-101 mixer pump testing & misc. water in May.
- There was a net change of +110,000 gallons in the DST system for May 2000.
- The total DST inventory as of May 31, 2000 was 19,931 million gallons.
- There was ~10 Kgal of Saltwell Liquid (SWL) pumped to the East Area DSTs (101-AN) in May.
- There was ~78 Kgal of Saltwell Liquid (SWL) pumped to the West Area DSTs (102-SY) in May.
- The SWL numbers are preliminary and are subject to change once cognizant engineers do a validation, the volumes reported contain actual waste volume plus any water added for dilution and transfer line flushes.
- Evaporator Campaign 00-01 was completed May 5th, 2000. Evaporator 242-A achieved a total Waste Volume Reduction (WVR) of ~682,000 gallons during campaign 00-01 (641,000 in April and 41,000 in May).
- Testing of the newly installed mixer pump in Tank 241-AZ-101 commenced in May. Testing required ~59 Kgal of water (added to Tank 241-AZ-101). A material balance of Tank 241-AZ-101 inventories will be conducted by cognizant engineers once mixer pump testing is complete and the tank waste has settled.

| MAY 2000 DST WASTE RECEIPTS | | | | | |
|-----------------------------|--------------------|-----------------------------|--------------|------------------------------|----------|
| FACILITY GENERATIONS | | OTHER GAINS ASSOCIATED WITH | | OTHER LOSSES ASSOCIATED WITH | |
| SWL (West) | +78 Kgal (28Y) | SLURRY | +1 Kgal | SLURRY | -3 Kgal |
| SWL (East) | +10 Kgal (1AN) | CONDENSATE | +10 Kgal | CONDENSATE | -5 Kgal |
| Tank Farms | +46 Kgal (1AZ,8AP) | INSTRUMENTATION | +1 Kgal | INSTRUMENTATION | -2 Kgal |
| TOTAL | +132 Kgal | UNKNOWN | +21 Kgal (*) | UNKNOWN | -4 Kgal |
| | | TOTAL | +33 Kgal | TOTAL | -14 Kgal |

(*) The majority of the gain to "UNKNOWN" (17 Kgal) is due to material balance discrepancy during Tank 101-AZ mixer pump testing. Adjustments will be made once cognizant engineers evaluate mixer pump test data.

APPENDIX D
WASTE TANK SURVEILLANCE MONITORING TABLES

TABLE D-1. TEMPERATURE MONITORING IN WATCH LIST TANKS (Sheet 1 of 2)

May 31, 2000

These tanks have been identified as Watch List Tanks in accordance with Public Law 101-510, Section 3137, "Safety Measures for Waste Tanks at Hanford Nuclear Reservation," (1990), because they "... may have a serious potential for release of high-level waste due to uncontrolled increases in temperature or pressure."

All Watch List tanks are reviewed for increasing temperature trends. Temperatures in these tanks are monitored by the Tank Monitor And Control System (TMACS), unless indicated otherwise.

Temperatures are taken in the waste unless in-waste thermocouples are out of service. Temperatures below are the highest temperatures recorded in these tanks during this month.

Temperatures in Degrees F.

| SINGLE-SHELL TANKS | | | | | |

| SY-101 | 101 | 1/91 | | | |
| SY-103 | 94 | 1/91 | | | |
| 6 DSTs | | | | | |

All tanks were removed from the Ferrocyanide Watch List and 18 tanks from the Organics Watch List. Tank C-106 was removed from the High Heat Load Watch List on December 16, 1999. See Table A-3.

TABLE D-1. TEMPERATURE MONITORING IN WATCH LIST TANKS
(sheet 2 of 2)

Notes:**Unreviewed Safety Question (USQ):**

When a USQ is declared, special controls are required, and work in the tanks is limited. There are currently no USQs on single-shell tanks. There is a USQ on double-shell tank SY-101 for liquid level increase.

Hydrogen/Flammable Gas:

These tanks are suspected of having a significant potential for hydrogen/flammable gas generation, entrapment, and episodic release. The USQ associated with these tanks was closed in September 1998. Twenty-five tanks (19 SST and 6 DST) remain on the Hydrogen Watch List.

Organic Salts:

These tanks contain concentrations of organic salts ≥ 3 weight% of total organic carbon (TOC) (equivalent to 10 wt% sodium acetate). The USQ associated with these tanks was closed in October 1998, and 18 organic complexant tanks were removed from the Organic Watch List in December 1998. Two organic solvent tanks (C-102 and C-103) remain on the Organic Watch List.

High Heat:

These tanks contain heat generating strontium-rich sludge and require drainable liquid to be maintained in the tank to promote cooling. There are currently nine tanks on the High Heat Load List but no tanks on the High Heat Load Watch List.

Active ventilation:

There are 15 single-shell tanks on active ventilation (seven are on the Watch List as indicated by an asterisk):

| | |
|-----------|--------------|
| C-105 | SX-107 |
| C-106 (2) | SX-108 |
| SX-101 * | SX-109 * (1) |
| SX-102 * | SX-110 |
| SX-103 * | SX-111 |
| SX-104 * | SX-112 |
| SX-105 * | SX-114 |
| SX-106 * | |

Footnotes:

- (1) Tank SX-109 is on the Hydrogen Watch List as it has the potential for flammable gas accumulation only because other SX tanks vent through it.
- (2) Tank C-106 was removed from the High Heat Load Watch List on December 16, 1999. A process test to obtain an estimate of the amount of heat load remaining in the waste was completed on February 16, 2000. The remaining heat load in the tank is approximately 10,000 Btu/hr. A draft Process Test Report is being prepared.
- (3) TMACS is O/S due to power outage since August 1999, which caused damage to acromags in T, TX and TY farms. Readings taken manually.

TABLE D-2. TEMPERATURE MONITORING IN NON-WATCH LIST TANKS
May 31, 2000

SINGLE-SHELL TANKS WITH HIGH HEAT LOADS (>26,000 Btu/hr)

Nine tanks have high heat loads for which temperature surveillance requirements are established by HNF-SD-WM-TSR-006, Rev 1, *Tank Waste Remediation System Technical Safety Requirements*, December 1999.

In an analysis, WHC-SD-WM-SARR-010, Rev 1, *Heat Removal Characteristics of Waste Storage Tanks*, Kummerer, 1995, it was estimated that nine tanks have heat sources >26,000 Btu/hr, which is the new parameter for determining high heat load tanks. See also document HNF-SD-WM-BIO-001, Rev 1, *Tank Waste Remediation System Basis for Interim Operation*, Noorani, 1998.

Temperatures in these tanks did not exceed TSR requirements for this month, and are monitored by the Tank Monitor and Control System (TMACS), unless indicated otherwise. All high heat load tanks are on active ventilation.

| <u>Tank No.</u> | <u>Temperature (F.)</u> |
|-----------------|-------------------------|
| C-106 (1) | 63 (Riser #8) |
| SX-103 | 158 |
| SX-107 | 155 |
| SX-108 | 180 |
| SX-109 (2) | 133 |
| SX-110 | 161 |
| SX-111 | 182 |
| SX-112 | 145 |
| SX-114 | 173 |

2 Tanks

- Notes:
- (1) C-106 was removed from the High Heat Load Watch List on December 16, 1999. A process test to obtain an estimate of the amount of heat load remaining in the waste was completed on February 16, 2000. The remaining heat load in the tank is approximately 10,000 Btu/hr. A draft Process Test Report is being prepared.
 - (2) SX-109 is on the Hydrogen Watch List as it has the potential for flammable gas accumulation only because the other SX tanks vent through it.

SINGLE-SHELL TANKS WITH LOW HEAT LOADS (<26,000 Btu/hr)

There are 114 low heat load non-watch list tanks. Temperatures in tanks connected to TMACS are monitored by TMACS; temperatures in those tanks not yet connected to TMACS are manually taken semiannually in January and July. Temperatures obtained semiannually have been within historical ranges for the applicable tank.

No temperatures have been obtained for several years in the tanks listed below. Most of these tanks have no thermocouple tree.

| <u>Tank No.</u> | <u>Tank No.</u> |
|-----------------|-----------------|
| BX-104 | TX-101 |
| BY-102 | TX-110 |
| BY-109 | TX-114 |
| C-204 | TX-116 |
| SX-115 | TX-117 |
| T-102 | U-104 |
| T-105 | |

TABLE D-3. ADDITIONS/DELETIONS TO WATCH LISTS BY YEAR
May 31, 2000

Added/Deleted dates may differ from dates that tanks were officially added to the Watch Lists. (See Table A-1).

| | Ferrocyanide | Hydrogen | Organics | High Heat | Total Tanks (1) | | |
|--|---|-----------|--|------------|-----------------|-----|-------|
| | | | | | SST | DST | Total |
| Total December 31, 1991 | 23 | 23 | 0 | 1 | 47 | 0 | 52 |
| Added 2/91 (revision to Original List) | 1 T-107 | | | | 1 | | 1 |
| Total December 31, 1992 | 24 | 23 | 0 | 1 | 48 | 0 | 53 |
| Added 8/92 | | 1 AW-101 | | | | 1 | 1 |
| Total December 31, 1992 | 24 | 24 | 0 | 1 | 49 | 0 | 54 |
| Added 3/93 Deleted 7/93 | -4 (BX-110) (BX-111) (BY-101) (T-101) | | 1 U-111 | | 1 -4 | | |
| Added 12/93 | | 1 (U-107) | | | 0 | | |
| Total December 31, 1993 | 20 | 25 | 0 | 1 | 46 | 0 | 51 |
| Added 2/94 Added 5/94 | | | 1 T-111 10 A-101 AX-102 C-102 S-111 SX-103 TY-104 U-103 U-105 U-203 U-204 | | 1 4 | | |
| Deleted 11/94 | -2 (BX-102) (BX-106) | | | | -2 | | |
| Total December 31, 1995 | 18 | 25 | 20 | 1 | 44 | 0 | 54 |
| Deleted 5/96 | -4 (C-106) (C-109) (C-111) (C-112) | | | | -4 | | |
| Deleted 9/96 | -14 (BY-103) (BY-104) (BY-105) (BY-106) (BY-107) (BY-108) (BY-110) (BY-111) (BY-112) (T-107) (TX-118) (TY-101) (TY-103) (TY-104) | | | | -12 | | |
| Deleted 12/96 | | | -18 (A-101) (AX-102) (B-103) (B-102) (B-111) (BX-103) (BX-106) (T-111) (TX-106) (TX-118) (TY-104) (U-103) (U-105) (U-106) (U-107) (U-111) (U-203) (U-204) | | -10 | | |
| Total December 31, 1996 | 0 | 25 | 2 | 1 | 28 | 0 | 28 |
| Deleted 12/96 | | | | -1 (C-106) | -1 | | |
| Total January 1997 to May 2000 | | | | 0 | 21 | 0 | 27 |

(1) Eighteen of the 20 tanks were removed from the Organics Watch List in December 1996; eight of the tanks removed from the Organics List are also on the Hydrogen Watch List; therefore, the total tanks added/deleted depends upon whether a tank is also on another list.

TABLE D-4. SINGLE-SHELL TANKS MONITORING COMPLIANCE STATUS

149 TANKS (Sheet 1 of 6)

May 31, 2000

The following table indicates whether Single-Shell tank monitoring was in compliance with the requirements as specified in the applicable documents as of the last day of the applicable month:

NOTE:

All Watch List and High Heat tank temperature monitoring is in compliance. (4)

All Dome Elevation Survey monitoring is in compliance, with exception (see footnote 11).

All Psychrometrics monitoring is in compliance (2).

Drywell monitoring no longer required (5).

In-tank photos/videos are taken "as needed"

LEGEND:

| | |
|------------------|--|
| (Shaded) | = In compliance with all applicable documentation |
| N/C | = noncompliance with applicable documentation |
| O/S | = Out of Service |
| Neutron | = LOW readings taken by Neutron probe |
| POP | = Plant Operating Procedure, TO-040-850 |
| MT/FIC/ ENRAF | = Surface level measurement devices |
| OSD | = Operating Spec. Doc., OST-T-151-00013, 00030, 00031 |
| N/A | = Not applicable (not monitored, or no monitoring schedule) |
| None | = Applicable equipment not installed |
| FSAR/TSR | = Final Safety Analysis Report/Technical Safety Requirements |

| 149 tanks | Watch List Tanks (4) | High Heat Tanks (4) | | | | | | |

TABLE D-4. SINGLE-SHELL TANKS MONITORING COMPLIANCE STATUS -149 TANKS
(Sheet 5 of 6)

Footnotes:

1. All SSTs have either manual tape, FIC, or ENRAF surface level measuring devices. Some also have zip cords.

ENRAF gauges are being installed to replace FICs (or sometimes manual tapes). The ENRAF gauges are being connected to TMACS, but many are currently being read manually from the field. See Table D-6 for list of ENRAF installations.

2. High heat tanks have active exhausters; psychrometrics can be taken in the high heat tanks. Psychrometric readings are taken on an "as needed" basis with the exception of tanks C-105 and C-106. Document OSD-T-151-00013 requires psychrometric readings to be taken in C-105 and C-106 on a monthly frequency when the ventilation system is running. Psychrometric readings previously taken monthly in SX-farm will now be taken annually.
3. Tank C-106 was removed from the High Heat Load Watch List on December 16, 1999.
4. Temperature readings may be regulated by OSD, POP, or FSAR (FSAR only regulates high heat load tanks). Temperatures cannot be obtained in 13 low heat load tanks (see Table D-2). The OSD does not require readings or repair of out-of-service thermocouples for the low heat load ($\leq 26,000$ Btu/h) tanks. However, the POP requires that attempts are to be made semiannually in January and July to obtain readings for these tanks.

Temperatures in some tanks cannot be taken in the waste because the waste level is lower than the lowest thermocouple in these tanks.

Temperatures for many tanks are monitored continuously by TMACS; see Table D-7, TMACS Monitoring Status.

5. Document OSD-T-151-00031, "Operating Specifications for Tank Farm Leak Detection," REV C-0, January 13, 1999, requires that single-shell tanks with the surface level measurement device contacting liquid, partial liquid, or floating crust surface, will be monitored for leak detection on a daily basis. Tanks with a solid surface will be monitored for leak detection on a weekly basis by taking neutron scan data from a Liquid Observation Well (LOW), if an LOW is present. Tanks with a solid surface but without LOWs will not be monitored for leak detection if the tank has been interim stabilized, until an LOW is installed. The OSD specifies what leak detection methods are to be used for each tank, and the requirements if the readings are not taken on the required frequency or if equipment is out of service.

This OSD revision does not require drywell surveys to be taken: drywell scans will only be taken under extreme conditions; any scans would have to be subcontracted, as the contractor no longer has vans.

6. Leak detection for the catch tanks is performed by monitoring for the buildup of liquid in the secondary containment (for most tanks with secondary containment) or for decrease in the liquid level for those tanks without secondary containment or secondary containment monitoring.

Catch tank 240-S-302 is monitored for intrusions only, and is not subject to leak detection monitoring requirements until liquid is present above the intrusion level.

Weight Factor is the surface level measuring device currently used in A-417, A-350, 244-A Tank/Sump, and 244-S Tank/Sump. DCRT CR-003 is inactive and measured in gallons.

TABLE D-4. SINGLE-SHELL TANKS MONITORING COMPLIANCE STATUS - 149 TANKS
(Sheet 6 of 6)

7. Document SD-WM-TI-605, REV. 0, dated January 1994, describes the rationale for Liquid Observation Well (LOW) installation priority. This priority is based on tank leak status, tank surface condition, and tank stabilization status. Also included is a listing of tanks with the waste level being below two feet, which have no priority assigned because no effort will be made to install LOWs in the near future. LOW probes are unable to accurately monitor interstitial liquid levels less than two feet high.

Tanks which will not receive LOWs:

| | | | |
|--------|--------|--------|--------|
| A-102 | BX-101 | C-201 | T-106 |
| A-104 | BX-103 | C-202 | T-108 |
| A-105 | BX-105 | C-203 | T-109 |
| AX-102 | BX-106 | C-204 | TX-107 |
| AX-104 | BX-108 | SX-110 | TY-102 |
| B-102 | C-108 | SX-113 | TY-104 |
| B-103 | C-109 | SX-115 | TY-106 |
| B-112 | C-111 | T-102 | U-101 |
| | | T-103 | U-112 |

Total - 34 Tanks

8. Tank TX-105 - the LOW was in riser 8; the riser has been removed and the LOW has not been monitored since January 1987. Liquid levels are being taken in riser 9 by ENRAF and recorded in TMACS.
9. Tank AX-101 - LOW readings are taken by gamma sensors.
10. Tank S-110 - Neutron LOW scan taken on January 27, 2000, was more than 3 standard deviations above baseline, indicating a possible intrusion. Discrepancy Report 00-875 was issued February 1, 2000. Work Package 2W-99-0310 has been issued. The pit was foamed over on May 10, 2000, sealing the suspected intrusion location. A Neutron LOW scan taken on May 10 showed a normal reading. Discrepancy Report closed May 11, 2000.
11. Catch Tank AZ-151 - the FIC is not working correctly. Weekly readings will be obtained manually until an ENRAF is installed.

TABLE D-5. DOUBLE-SHELL TANKS MONITORING COMPLIANCE STATUS

28 TANKS (Sheet 1 of 2)

May 31, 2000

The following table indicates whether Double-Shell tank monitoring was in compliance with the requirements as specified in the applicable documents as of the last day of the applicable month.

NOTE:

Dome Elevation Surveys are not required for DSTs.

Psychrometrics and in-tank photos/videos are taken "as needed" (2)

TABLE D-5. DOUBLE-SHELL TANKS MONITORING COMPLIANCE STATUS - 28 TANKS
(Sheet 2 of 2)

Footnotes:

1. Some double-shell tanks have both FIC and manual tape which is used when the FIC is out of service. Noncompliance (N/C) will be shown when no readings are obtained. ENRAF gauges are being installed to replace FICs. The ENRAF gauges are being connected to TMACS, but some are currently being read manually.
2. Psychrometric readings are taken on an "as needed" basis. No psychrometric readings are currently being taken in the double-shell tanks.
3. OSD specifies double-shell tank temperature limits, gradients, etc.
4. Applicable OSD and HNF-IP-0842, latest revisions, are used as guidelines for monitoring Leak Detection Pits. See also (6) and (7) below.
5. AW-102 has ENRAF, FIC and M.T. At some point the FIC will be removed.
6. USQ TF-97-0038, dated April 28, 1997, specifies discontinuing the use of leak detection pit radiation monitoring equipment in all double-shell tank farms where the leak detection pits are used as tertiary leak detection. This applies to all double-shell tank farms.
7. Leak Detection Pit weekly readings are being obtained by Instrument Technicians in these tanks:
AP-103C (for tanks AP-101 - 104)
AP-105C (for tanks AP-105 - 108)
8. SY-103 - Manual Tape has sporadic readings. ENRAF is primary device.
SY-102 - Manual Tape has sporadic readings. ENRAF is primary device.

133 ENRAFs installed: 105 automatically entered into TMACS, 28 manually entered into SACS

TABLE D-7. TANK MONITOR AND CONTROL SYSTEM (TMACS)

May 31, 2000

Note: Indicated below are the number of tanks having at least one operating sensor monitored by TMACS.

Some tanks have more than one sensor: multiple sensors of the same type in a tank are not shown in the table (for example: 10 tanks in BY-Farm have at least one operating TC sensor and 3 tanks in BY-Farm have at least one operating RTD sensor).

Acceptance Testing Completed: Sensors Automatically Monitored by TMACS

| EAST AREA | Temperatures | | ENRAF Level Gauge | Pressure (b) | Hydrogen (c) | Gas Sample Flow |
|---------------------------------------|------------------------------|--|-------------------------|-----------------|-----------------|-----------------------|

| BY-Farm (12 Tanks) | 10 | 3 | 1 | | | |
| C-Farm (16 Tanks) | 15 (G) | 1 | 3 | 1 | | |
| TOTAL EAST AREA (91 Tanks) | 54 | 4 | 43 | 8 | 6 | 5 |
| WEST AREA | | | | | | |
| S-Farm (12 Tanks) | 12 | | 12 | 1 | 3 | 1 (f) |
| SX-Farm (15 Tanks) | 14 | | 14 | 1 | 7 | 5 (f) |
| SY-Farm (3 Tanks) (a) | 3 | | 3 | 1 | 2 | 2 |
| T-Farm (16 Tanks) (d) | 14 | 1 | 3 | | 1 | (f) |
| TX-Farm (18 Tanks) (d) | 13 | | 18 | | | |
| TY-Farm (6 Tanks) (d) | 6 | 3 | 6 | | | |
| U-Farm (16 Tanks) | 15 | | 6 | 4 | 6 | 6 |
| TOTAL WEST AREA (86 Tanks) | 77 | 4 | 62 | 7 | 19 | 19 |
| TOTALS (177 Tanks) | 131 | 8 | 105 | 15 | 25 | 24 |

- (a) Tank SY-101 has 2 gas sample flow sensors plus 2 vent flow sensors, and 2 ENRAFs.
- (b) Each tank has two sensors (high and low range).
- (c) Each tank has two sensors (high and low range).
- (d) TMACS has been out of service since August 1999 due to power outage which caused damage to acromags in T, TX and TY farms. Readings taken manually.
- (e) BX-106, 108, and 109 ENRAFs out of service. Manual readings taken quarterly.
- (f) S, SX, and T-Farms - five gas sample flow sensors have been unhooked or removed. Will eventually use SHMS equipment on other tanks but none scheduled yet.

N/A = not applicable (not yet interim stabilized)

TABLE F-1. SINGLE-SHELL LEAK VOLUME ESTIMATES
(Sheet 2 of 5)

Footnotes:

- (1) Current estimates [see reference(b)] are that 610 Kgallons of cooling water was added to Tank 241-A-105 from November 1970 to December 1978 to aid in evaporative cooling. In accordance with Dangerous Waste Regulations [Washington Administrative Code 173-303-070 (2)(a)(ii), as amended, Washington State Department of Ecology, 1990, Olympia, Washington], any of this cooling water that has been added and subsequently leaked from the tank must be classified as a waste and should be included in the total leak volume. In August 1991, the leak volume estimate for this tank was updated in accordance with the WAC regulations. Previous estimates excluded the cooling water leaks from the total leak volume estimates because the waste content (concentration) in the cooling water which leaked should be much less than the original liquid waste in the tank (the sludge is relatively insoluble). The total leak volume estimate in this report (10 Kgallons to 277 Kgallons) is based on the following (see References):

1. Reference (b) contains an estimate of 5 Kgallons to 15 Kgallons for the initial leak prior to August 1968.
2. Reference (b) contains an estimate of 5 Kgallons to 30 Kgallons for the leak while the tank was being sluiced from August 1968 to November 1970.
3. Reference (b) contains an estimate of 610 Kgallons of cooling water added to the tank from November 1970 to December 1978 but it was estimated that the leakage was small during this period. This reference contains the statement "Sufficient heat was generated in the tank to evaporate most, and perhaps nearly all, of this water." This results in a low estimate of zero gallons leakage from November 1970 to December 1978.
4. Reference (c) contains an estimate the 378 to 410 Kgallons evaporated out of the tank from November 1970 to December 1978. Subtracting the minimum evaporation estimate from the cooling water added estimate provides a range from 0 to 232 Kgallons of cooling water leakage from November 1970 to December 1978.

| | <u>Low Estimate</u> | <u>High Estimate</u> |
|--------------------------------|---------------------|----------------------|
| Prior to August 1968 | 5,000 | 15,000 |
| August 1968 to November 1970 | 5,000 | 30,000 |
| November 1970 to December 1978 | <u>0</u> | <u>232,000</u> |
| Totals | 10,000 | 277,000 |

- (2) These leak volume estimates do not include (with some exceptions), such things as: (a) cooling/raw water leaks, (b) intrusions (rain infiltration) and subsequent leaks, (c) leaks inside the tank farm but not through the tank liner (surface leaks, pipeline leaks, leaks at the joint for the overflow or fill lines, etc.), and (d) leaks from catch tanks, diversion boxes, encasements, etc.
- (3) In many cases, a leak was suspected long before it was identified or confirmed. For example, reference (d) shows that Tank 241-U-104 was suspected of leaking in 1956. The leak was "confirmed" in 1961. This report lists the "assumed leaker" date of 1961. Using present standards, Tank 241-U-104 would have been declared an assumed leaker in 1956. In 1984, the criteria designations of "suspected leaker," "questionable integrity," "confirmed leaker," "declared leaker," "borderline" and "dormant," were merged into one category now reported as "assumed leaker." See reference (f) for explanation of when, how long, and how fast some of the tanks leaked. It is highly likely that there have been undetected leaks from single-shell tanks because of the nature of their design and instrumentation.

TABLE F-1. SINGLE-SHELL TANK LEAK VOLUME ESTIMATES

(Sheet 3 of 5)

- (4) The leak volume estimate date for these tanks is before the "declared leaker" date because the tank was in a "suspected leaker" or "questionable integrity" status; however, a leak volume had been estimated prior to the tank being reclassified.
- (5) The increasing radiation levels in drywells and laterals associated with these three tanks could be indicating continuing leak or movement of existing radionuclides in the soil. There is no conclusive way to confirm these observations.
- (6) Methods were used to estimate the leak volumes from these 19 tanks based on the assumption that their cumulative leakage is approximately the same as for 18 of the 24 tanks identified in footnote (9). For more details see reference (g). The total leak volume estimate for these tanks is 150 Kgallons (rounded to the nearest Kgallons), for an average of approximately 8 Kgallons for each of 19 tanks.
- (7) The total has been rounded to the nearest 50 Kgallons. Upper bound values were used in many cases in developing these estimates. It is likely that some of these tanks have not actually leaked.
- (8) Leak volume estimate is based solely on observed liquid level decreases in these tanks. This is considered to be the most accurate method for estimating leak volumes.
- (9) The curie content shown is as listed in the reference document and is not decayed to a consistent date; therefore, a cumulative total is inappropriate.
- (10) Tank 241-C-101 experienced a liquid level decrease in the late 1960s and was taken out of service and pumped to a "minimum heel" in December 1969. In 1970, the tank was classified as a "questionable integrity" tank. Liquid level data show decreases in level throughout the 1970s and the tank was saltwell pumped during the 1970s, ending in April 1979. The tank was reclassified as a "confirmed leaker" in January 1980. See references (q) and (s); refer to reference (s) for information on the potential for there to have been leaks from other C-farm tanks (specifically, C-102, C-103, and C-109).
- (11) These dates indicate when the tanks were declared to be interim stabilized. In some cases, the official interim stabilization documents were issued at a later date. Also, in some cases, the field work associated with interim stabilization was completed at an earlier date.
- (12) Tank T-111 was declared an assumed re-leaker on February 28, 1994, due to a decreasing trend in surface level measurement. This tank was pumped, and interim stabilization completed on February 22, 1995.
- (13) Tank BX-111 was declared an assumed re-leaker in April 1993. Preparations for pumping were delayed, following an administrative hold placed on all tank farm operations in August 1993. Pumping resumed and the tank was declared interim stabilized on March 15, 1995.
- (14) The leak volume and curie release estimates on SX-108, SX-109, SX-111, and SX-112 have been re-evaluated using a Historical Leak Model [see reference (u)]. In general, the model estimates are much higher than the values listed in the table, both for volume and curies released. The values listed in the table do not reflect this revised estimate because, "In particular, it is worth emphasizing that this report was never meant to be a definitive update for the leak baseline at the Hanford Site. It was rather meant to be an attempt to view the issue of leak inventories with a new and different methodology." (This quote is from the first page of the referenced report).

LEGEND:

AR = Administratively interim stabilized

JET = Saltwell jet pumped to remove drainable interstitial liquid

SN = Supernate pumped (Non-Jet pumped)

N/A = Not yet interim stabilized

ASMD LKR = Assumed Leaker

| | |
|---------------------------------|------------|
| Interim Stabilized Tanks | 124 |
| Not Yet Interim Stabilized | 25 |
| Total Single-Shell Tanks | 149 |

TABLE G-1. SINGLE-SHELL TANKS INTERIM STABILIZATION STATUS
(sheet 2 of 2)

Footnotes:

- (1) These dates indicate when the tanks were actually interim stabilized. In some cases, the official interim stabilization documents were issued at a later date.

- (2) Although tanks, BX-103, T-102 and T-112 met the interim stabilization administrative procedure at the time they were stabilized, they no longer meet the recently updated administrative procedure. The tanks were re-evaluated in 1996 and memo 9654456, J. H. Wicks to Dr. J. K. McClusky, DOE-RL, dated September 1996, was issued which recommended that no further pumping be performed on these tanks, based on an economic evaluation.

Document RPP-5556, Rev. 0, "Updated Drainable Interstitial Liquid Volume Estimates for 119 Single-Shell Tanks Declared Stabilized," J. G. Field, February 7, 2000, states that five tanks no longer meet the stabilization criteria (BX-103, T-102, and T-112 exceed the supernate criteria, and BY-103 and C-102 exceed the DIL criteria).

An intrusion investigation was completed on tank B-202 in 1996 because of a detected increase in surface level. As a result of this investigation, it was determined that this tank no longer meets the recently updated administrative procedure for 200 series tanks.

- (3) Original Interim Stabilization data are missing on four tanks: B-201, T-102, T-112, and T-201.
- (4) Tank 241-T-104 was Interim Stabilized on November 19, 1999. In-tank video taken October 7, 1999, shows the surface is clearly sludge-type waste with no saltcake present. No visible water on surface. Waste surface appears level across tank with numerous cracks. There is a minimal collapsed area around the saltwell screen, with no visible bottom.
- (5) Tank 241-T-110 was Interim Stabilized on January 5, 2000, due to major equipment failure. An in-tank video taken October 7, 1999 (pumping was discontinued on August 12, 1999), showed the surface of this tank as smooth, brown-tinted sludge with visible cracks.
- (6) Tank 241-S-103 was declared Interim Stabilized April 18, 2000. The surface is a rough, black and brown-colored waste with yellow patches of saltcake visible throughout. The surface appears to be damp but not saturated, and shows irregular cracking typically seen with surfaces beginning to dry out. A pool of supernatant liquid (10 feet in diameter, 5 feet deep, 1.0 Kgallons) is visible from video observations.
- (7) Tank 241-SX-104 was declared Interim Stabilized April 26, 2000, due to major equipment failure. The surface is a rough, yellowish gray saltcake waste with an irregular surface of visible cracks and shelves that were created as the surface dried out. The waste surface appears to be dry and shows no standing water within the tank.
- (8) Tank 241-SX-106 was declared Interim Stabilized May 5, 2000. The surface is a smooth, white-colored saltcake waste. The surface level slopes slightly from the tank sidewall down to a large depression in the center of the tank. A second depression surrounds both saltwell screens and an abandoned LOW. The waste surfaces appear dry and show no standing water within the tank.

TABLE G-2. SINGLE-SHELL TANK INTERIM STABILIZATION MILESTONES

May 31, 2000

(sheet 1 of 2)

New single-shell tank interim stabilization milestones were negotiated in 1999 and are identified in the "Consent Decree." The Consent Decree was approved on August 16, 1999.

CONSENT DECREE
Attachments A-1 and A-2

Following is the schedule for pumping liquid waste from the remaining twenty-nine (29) single-shell tanks. This schedule is enforceable pursuant to the terms of the Decree except for the "Project Pumping Completion Dates" which are estimates only and not enforceable. (Note: Schedule does not include C-106)

| Tank Designation | Pumping Initiated | Projected Pumping Completion Date | Interim Stabilization Date |
|------------------|---|-----------------------------------|----------------------------|
| 1. T-104 | Already initiated | May 30, 1999 | November 19, 1999 |
| 2. T-110 | Already initiated | May 30, 1999 | January 5, 2000 |
| 3. SX-104 | Already initiated | December 30, 2000 | April 26, 2000 |
| 4. SX-106 | Already initiated | December 30, 2000 | May 5, 2000 |
| 5. S-102 | Already initiated | March 30, 2001 | |
| 6. S-106 | Already initiated | March 30, 2001 | |
| 7. S-103 | Already initiated | March 30, 2001 | April 18, 2000 |
| 8. U-103* | September 26, 1999 | April 15, 2002 | |
| 9. U-105* | December 10, 1999 | April 15, 2002 | |
| 10. U-102* | January 20, 2000 | April 15, 2002 | |
| 11. U-109* | March 11, 2000 | April 15, 2002 | |
| 12. A-101 | May 6, 2000 | September 30, 2003 | |
| 13. AX-101 | October 30, 2000 | September 30, 2003 | |
| 14. SX-105 | March 15, 2001 | February 28, 2003 | |
| 15. SX-103 | March 15, 2001 | February 28, 2003 | |
| 16. SX-101 | March 15, 2001 | February 28, 2003 | |
| 17. U-106* | March 15, 2001 | February 28, 2003 | |
| 18. BY-106 | July 15, 2001 | June 30, 2003 | |
| 19. BY-105 | July 15, 2001 | June 30, 2003 | |
| 20. U-108 | December 30, 2001 | August 30, 2003 | |
| 21. U-107 | December 30, 2001 | August 30, 2003 | |
| 22. S-111 | December 30, 2001 | August 30, 2003 | |
| 23. SX-102 | December 30, 2001 | August 30, 2003 | |
| 24. U-111 | November 30, 2002 | September 30, 2003 | |
| 25. S-109 | November 30, 2002 | September 30, 2003 | |
| 26. S-112 | November 30, 2002 | September 30, 2003 | |
| 27. S-101 | November 30, 2002 | September 30, 2003 | |
| 28. S-107 | November 30, 2002 | September 30, 2003 | |
| 29. C-103 | No later than December 30, 2000, DOE will determine whether the organic layer and pumpable liquids will be pumped from Tank C-103 together or separately, and will establish a deadline for initiating pumping of this tank. The parties will incorporate the initiation deadline into this schedule as provided in Section VI of the Decree. CHG issued a contract to a subcontractor for scope and cost estimate. RPP-6310, "Removal of Separable Organic from C-103 Scoping Study," was issued in May 2000, and forwarded to DOE for review. | | |

* Tanks containing organic complexants.

TABLE G-2. SINGLE-SHELL TANK INTERIM STABILIZATION MILESTONES
(sheet 2 of 2)

Completion of Interim Stabilization. DOE will complete interim stabilization of all 29 single-shell tanks listed above by September 30, 2004.

Percentage of Pumpable Liquid Remaining to be Removed.

| | |
|---|-----------|
| 93% of Total Liquid | 9/30/1999 |
| 38% of Organic Complexed Pumpable Liquids | 9/30/2000 |
| 5% of Organic Complexed Pumpable Liquids | 9/30/2001 |
| 18% of Total Liquid | 9/30/2002 |
| 2% of Total Liquid | 9/30/2003 |

The "percentage of pumpable liquid remaining to be removed" is calculated by dividing the volume of pumpable liquid remaining to be removed from tanks not yet interim stabilized by the sum of the total amount of liquid that has been pumped and the pumpable liquid that remains to be pumped from all tanks.

TABLE G-3. SINGLE-SHELL TANKS STABILIZATION STATUS SUMMARY

May 31, 2000

APPENDIX H

**TANKS AND EQUIPMENT CODE AND
STATUS DEFINITIONS**

TABLE H - 1. TANK AND EQUIPMENT CODE/STATUS DEFINITIONS
May 31, 2000

1. TANK STATUS CODES**WASTE TYPE** (also see definitions, section 3)

| | |
|-------|--|
| AGING | Aging Waste (Neutralized Current Acid Waste [NCAW]) |
| CC | Complexant Concentrate Waste |
| CP | Concentrated Phosphate Waste |
| DC | Dilute Complexed Waste |
| DN | Dilute Non-Complexed Waste |
| DSS | Double-Shell Slurry |
| DSSF | Double-Shell Slurry Feed |
| NCPLX | Non-Complexed Waste |
| PD/PN | Plutonium-Uranium Extraction (PUREX) Neutralized Cladding Removal Waste (NCRW), transuranic waste (TRU) |
| PT | Plutonium Finishing Plant (PFP) TRU Solids |

TANK USE (DOUBLE-SHELL TANKS ONLY)

| | |
|-------|---------------------------------|
| CWHT | Concentrated Waste Holding Tank |
| DRCVR | Dilute Receiver Tank |
| EVFD | Evaporate Feed Tank |
| SRCVR | Slurry Receiver Tank |

2. SOLID AND LIQUID VOLUME DETERMINATION METHODS

| | |
|---|---|
| F | Food Instrument Company (FIC) Automatic Surface Level Gauge |
| E | ENRAF Surface Level Gauge (being installed to replace FICs) |
| M | Manual Tape Surface Level Gauge |
| P | Photo Evaluation |
| S | Sludge Level Measurement Device |

3. DEFINITIONS**WASTE TANKS - GENERAL****Waste Tank Safety Issue**

A potentially unsafe condition in the handling of waste material in underground storage tanks that requires corrective action to reduce or eliminate the unsafe condition.

Watch List Tank

An underground storage tank containing waste that requires special safety precautions because it may have a serious potential for release of high level radioactive waste because of uncontrolled increases in temperature or pressure. Special restrictions have been placed on these tanks by "Safety Measures for Waste Tanks at Hanford Nuclear Reservation," Section 3137 of the *National Defense Authorization Act for Fiscal Year 1991*, November 5, 1990, Public Law 101-510, (also known as the Wyden Amendment).

Characterization

Characterization is understanding the Hanford tank waste chemical, physical, and radiological properties to the extent necessary to insure safe storage and interim operation, and ultimate disposition of the waste.

WASTE TYPES

Aging Waste (AGING)

High level, first cycle solvent extraction waste from the PUREX plant (NCAW)

Concentrated Complexant (CC)

Concentrated product from the evaporation of dilute complexed waste.

Concentrated Phosphate Waste (CP)

Waste originating from the decontamination of the N Reactor in the 100 N Area. Concentration of this waste produces concentrated phosphate waste.

Dilute Complexed Waste (DC)

Characterized by a high content of organic carbon including organic complexants: ethylenediaminetetraacetic acid (EDTA), citric acid, and hydroxyethyl-ethylenediaminetriacetic acid (HEDTA), being the major complexants used. Main sources of DC waste in the DST system are saltwell liquid inventory (from SSTs).

Dilute Non-Complexed Waste (DN)

Low activity liquid waste originating from T and S Plants, the 300 and 400 Areas, PUREX facility (decladding supernatant and miscellaneous wastes), 100 N Area (sulfate waste), B Plant, saltwells, and PFP (supernate).

Double-Shell Slurry (DSS)

Waste that exceeds the sodium aluminate saturation boundary in the evaporator without exceeding receiver tank composition limits. For reporting purposes, DSS is considered a solid.

Double-Shell Slurry Feed (DSSF)

Waste concentrated just before reaching the sodium aluminate saturation boundary in the evaporator without exceeding receiver tank composition limits. This form is not as concentrated as DSS.

Non-complexed (NCPLX)

General waste term applied to all Hanford Site (NCPLX) liquors not identified as complexed.

PUREX Decladding (PD)

PUREX Neutralized Cladding Removal Waste (NCRW) is the solids portion of the PUREX plant neutralized cladding removal waste stream; received in Tank Farms as a slurry. NCRW solids are classified as transuranic (TRU) waste.

PFP TRU Solids (PT)

TRU solids fraction from PFP Plant operations.

Drainable Interstitial Liquid (DIL)

Interstitial liquid that is not held in place by capillary forces, and will therefore migrate or move by gravity. (See also Section 4)

Supernate

The liquid above the solids or in large liquid pools covered by floating solids in waste storage tanks. (See also Section 4 below)

Ferrocyanide

A compound of iron and cyanide commonly expressed as FeCN . The actual formula for the ferrocyanide anion is $[\text{Fe}(\text{CN})_6]^{4-}$.

INTERIM STABILIZATION (Single-Shell Tanks only)**Interim Stabilized (IS)**

A tank which contains less than 50 Kgallons of drainable interstitial liquid and less than 5 Kgallons of supernatant liquid. If the tank was jet pumped to achieve interim stabilization, then the jet pump flow or saltwell screen inflow must also have been at or below 0.05 gpm before interim stabilization criteria is met.

Jet Pump

The jet pump system includes 1) a jet assembly with foot valve mounted to the base of two pipes that extend from the top of the well to near the bottom of the well casing inside the saltwell screen, 2) a centrifugal pump to supply power fluid to the down-hole jet assembly, 3) flexible or rigid transfer jumpers, 4) a flush line, and 5) a flowmeter. The jumpers contain piping, valves, and pressure and limit switches.

The centrifugal pump and jet assembly are needed to pump the interstitial liquid from the saltwell screen into the pump pit, nominally a 40-foot elevation rise. The power fluid passes through a nozzle in the jet assembly and acts to convert fluid pressure head to velocity head, thereby reducing the pressure in the jet assembly chamber. The reduction in pressure allows the interstitial liquid to enter the jet assembly chamber and mix with the power fluid. Velocity head is converted to pressure head above the nozzle, lifting power fluid, and interstitial liquid to the pump pit. Pumping rates vary from 0.05 gallons to about 4 gpm.

Saltwell Screen

The saltwell system is a 10-inch diameter saltwell casing consisting of a stainless steel saltwell screen welded to a Schedule 40 carbon steel pipe. The casing and screen are to be inserted into the 12-inch tank riser located in the pump pit. The stainless steel screen portion of the system will extend through the tank waste to near the bottom of the tank. The saltwell screen portion of the casing is an approximately 10-foot length of 300 Series, 10-inch diameter, stainless steel pipe with screen openings (slots) of 0.05 inches.

Emergency Pumping Trailer

A 45-foot tractor-type trailer is equipped to provide storage space and service facilities for emergency pumping equipment: this consists of two dedicated jet pump jumpers and two jet pumps, piping and dip tubes for each, two submersible pumps and attached piping, and a skid-mounted Weight Factor Instrument Enclosure (WFIE) with an air compressor and electronic recording instruments. The skid also contains a power control station for the pumps, pump pit leak detection, and instrumentation. A rack for over 100 feet of overground double-contained piping is also in the trailer.

INTRUSION PREVENTION (ISOLATION) Single-Shell Tanks only**Partially Interim Isolated (PI)**

The administrative designation reflecting the completion of the physical effort required for Interim Isolation except for isolation of risers and piping that is required for jet pumping or for other methods of stabilization.

Interim Isolated (II)

The administrative designation reflecting the completion of the physical effort required to minimize the addition of liquids into an inactive storage tank, process vault, sump, catch tank, or diversion box. In June 1993, Interim Isolation was replaced by Intrusion Prevention.

Intrusion Prevention (IP)

Intrusion Prevention is the administrative designation reflecting the completion of the physical effort required to minimize the addition of liquids into an inactive storage tank, process vault, sump, catch tank,

or diversion box. Under no circumstances are electrical or instrumentation devices disconnected or disabled during the intrusion prevention process (with the exception of the electrical pump).

Controlled, Clean, and Stable (CCS)

Controlled, Clean, and Stable reflects the completion of several objectives: "Controlled" - provide remote monitoring for required instrumentation and implement controls required in the TWRS Authorization Basis; "Clean" - remove surface soil contamination and downpost the Tank Farms to RBA/URMA/RA radiological control status, remove abandoned equipment, and place reusable equipment in compliant storage; and "Stable" - remove pumpable liquids from the SSTs and IMUSTs and isolate the tanks.

TANK INTEGRITY

Sound

The integrity classification of a waste storage tank for which surveillance data indicate no loss of liquid attributed to a breach of integrity.

Assumed Leaker

The integrity classification of a waste storage tank for which surveillance data indicate a loss of liquid attributed to a breach of integrity.

Assumed Re-Leaker

A condition that exists after a tank has been declared as an "assumed leaker" and then the surveillance data indicates a new loss of liquid attributed to a breach of integrity.

TANK INVESTIGATION

Intrusion

A term used to describe the infiltration of liquid into a waste tank.

SURVEILLANCE INSTRUMENTATION

Drywells

Drywells are vertical boreholes with 6-inch (internal diameter) carbon steel casings positioned radially around SSTs. These wells range between 50 and 250 feet in depth, and are monitored between the range of 50 to 150 feet. The wells are sealed when not in use. They are called drywells because they do not penetrate to the water table and are therefore usually "dry." There are 759 drywells.

Monitoring is done by gamma radiation or neutron-moisture sensors to obtain scan profiles of radiation or moisture in the soil as a function of well depth, which could be indicative of tank leakage.

All drywell scans are by request only, and only under "extreme" conditions. The contractor no longer has vans to perform the scans; any future scans would be subcontracted.

Laterals

Laterals are horizontal drywells positioned under single-shell waste storage tanks to detect radionuclides in the soil which could be indicative of tank leakage. These drywells can be monitored by radiation detection probes. Laterals are 4-inch inside diameter steel pipes located 8 to 10 feet below the tank's concrete base. There are three laterals per tank. Laterals are located only in A and SX farms. There are currently no functioning laterals and no plan to prepare them for use.

Surface Levels

The surface level measurements in all waste storage tanks are monitored by manual or automatic conductivity probes, and recorded and transmitted or entered into the Surveillance Analysis Computer System (SACS).

Automatic FIC

An automatic waste surface level measurement device is manufactured by the Food Instrument Company (FIC). The instrument consists of a conductivity electrode (plummet) connected to a calibrated steel tape, a steel tape reel housing and a controller that automatically raises and lowers the plummet to obtain a waste surface level reading. The controller can provide a digital display of the data and until February 1999, the majority of the FICs transmitted readings to the CASS. Since CASS retirement, all FIC gauges are read manually. FICs are being replaced by ENRAF detectors (see below).

ENRAF 854 ATG Level Detector

FICs and some manual tapes are in the process of being replaced by the ENRAF ATG 854 level detector. The ENRAF gauge, fabricated by ENRAF Incorporated, determines waste level by detecting variations in the weight of a displacer suspended in the tank waste. The displacer is connected to a wire wound onto a precision measuring drum. A level causes a change in the weight of the displacer which will be detected by the force transducer. Electronics within the gauge causes the servo motor to adjust the position of the displacer and compute the tank level based on the new position of the displacer drum. The gauge displays the level in decimal inches. The first few ENRAFs that received remote reading capability transmit liquid level data via analog output to the Tank Monitor and Control System (TMACS). The remaining ENRAFs and future installations will transmit digital level data to TMACS via an ENRAF Computer Interface Unit (CIU). The CIU allows fully remote communication with the gauge, minimizing tank farm entry.

Annulus

The annulus is the space between the inner and outer shells on DSTs only. Drain channels in the insulating and/or supporting concrete carry any leakage to the annulus space where conductivity probes are installed. The annulus conductivity probes and radiation detectors are the primary means of leak detection for all DSTs.

Liquid Observation Well (LOW)

In-tank liquid observation wells are used for monitoring the interstitial liquid level (ILL) in single-shell waste storage tanks. The wells are usually constructed of fiberglass or TEFZEL-reinforced epoxy-polyester resin (TEFZEL, a trademark of E. I. du Pont de Nemours & Company). There are a few LOWs constructed of steel. LOWs are sized to extend to within 1 inch of the bottom of the waste tank, are sealed at their bottom ends and have a nominal outside diameter of 3.5 inches. Two probes are used to monitor changes in the ILL; gamma and neutron, which can indicate intrusions or leakage by increases or decreases in the ILL. There are 65 LOWs (64 are in operation) installed in SSTs that contain or are capable of containing greater than 50 Kgallons of drainable interstitial liquid, and in two DSTs only. The LOWs installed in two DSTs, (SY-102 and AW-103 tanks), are used for special, rather than routine, surveillance purposes only.

Thermocouple (TC)

A thermocouple is a thermoelectric device used to measure temperature. More than one thermocouple on a device (probe) is called a thermocouple tree. In DSTs there may be one or more thermocouple trees in risers in the primary tank. In addition, in DSTs only, there are thermocouple elements installed in the insulating concrete, the lower primary tank knuckle, the secondary tank concrete foundation, and in the outer structural concrete.

These monitor temperature gradients within the concrete walls, bottom of the tank, and the domes. In SSTs, one or more thermocouples may be installed directly in a tank, although some SSTs do not have any trees installed. A single thermocouple (probe) may be installed in a riser, or lowered down an existing

riser or LOW. There are also four thermocouple laterals beneath Tank 105-A in which temperature readings are taken in 34 thermocouples.

In-tank Photographs and Videos

In-tank photographs and videos may be taken to aid in resolving in-tank measurement anomalies and determine tank integrity. Photographs and videos help determine sludge and liquid levels by visual examination.

4. INVENTORY AND STATUS BY TANK - COLUMN VOLUME CALCULATIONS AND DEFINITIONS FOR TABLE A-6 (SINGLE-SHELL TANKS)

| COLUMN HEADING | COLUMN VOLUME CALCULATIONS (<u>Underlined</u>)/DEFINITIONS |
|----------------|---|
| Total Waste | <u>Solids volume plus Supernatant liquid.</u> Solids include sludge and saltcake (see definitions below). |

| COLUMN HEADING | COLUMN VOLUME CALCULATIONS (Underlined)/DEFINITIONS |
|---|--|
| Supernate (1) | <u>May be either measured or estimated.</u> Supernate is either the estimated or measured liquid floating on the surface of the waste or under a floating solids crust. In-tank photographs or videos are useful in estimating the liquid volumes; liquid floating on solids and core sample data are useful in estimating large liquid pools under a floating crust. |
| Drainable Interstitial Liquid (DIL) (1) | <u>This is initially calculated.</u> Drainable interstitial liquid is calculated based on the saltcake and sludge volumes, using calculated porosity values from past pumping or actual data for each tank. Interstitial liquid is liquid that fills the interstitial spaces of the solids waste. The sum of the interstitial liquid contained in saltcake and sludge minus an adjustment for capillary height is the initial volume of drainable interstitial liquid. |
| Pumped This Month | <u>Net total gallons of liquid pumped from the tank during the month.</u> If supernate is present, pump production is first subtracted from the supernatant volume. The remainder is then subtracted from the drainable interstitial liquid volume. |
| Total Pumped (1) | <u>Cumulative net total gallons of liquid pumped from 1979 to date.</u> |
| Drainable Liquid Remaining (DLR) (1) | <u>Supernate plus Drainable Interstitial Liquid.</u> The total Drainable Liquid Remaining is the sum of drainable interstitial liquid and supernate. |
| Pumpable Liquid Remaining (PLR) (1) | <u>Drainable Liquid Remaining minus unpumpable volume.</u> Not all drainable interstitial liquid is pumpable. |
| Sludge | <u>Solids formed during sodium hydroxide additions to waste.</u> Sludge usually was in the form of suspended solids when the waste was originally received in the tank from the waste generator. In-tank photographs or videos may be used to estimate the volume. |
| Saltcake | <u>Results from crystallization and precipitation after concentration of liquid waste, usually in an evaporator.</u> If saltcake is layered over sludge, it is only possible to measure total solids volume. In-tank photographs or videos may be used to estimate the saltcake volume. |
| Solids Volume Update | <u>Indicates the latest update of any change in the solids volume.</u> |
| Solids Update Source - See Footnote | <u>Indicates the source or basis of the latest solids volume update.</u> |
| Last In-tank Photo | <u>Date of last in-tank photographs taken.</u> |
| Last In-tank Video | <u>Date of last in-tank video taken.</u> |
| See Footnotes for These Changes | <u>Indicates any change made the previous month.</u> A footnote explanation for the change follows the Inventory and Status by Tank Appendix (Table E-6). |

- (1) As pumping continues, supernate, DIL, DLR, PLR, and total gallons pumped are adjusted accordingly based on actual pump volumes.
